

How to Perform a One-Way ANOVA in Python

A **one-way ANOVA** (“analysis of variance”) is used to determine whether or not there is a statistically significant difference between the means of three or more independent groups.

This tutorial explains how to perform a one-way ANOVA in Python.

Example: One-Way ANOVA in Python

A researcher recruits 30 students to participate in a study. The students are **randomly assigned** to use one of three studying techniques for the next three weeks to prepare for an exam. At the end of the three weeks, all of the students take the same test.

Use the following steps to perform a one-way ANOVA to determine if the average scores are the same across all three groups.

Step 1: Enter the data.

First, we'll enter the exam scores for each group into three separate arrays:

```
#enter exam scores for each group  
group1 = [85, 86, 88, 75, 78, 94, 98, 79, 71, 80]  
group2 = [91, 92, 93, 85, 87, 84, 82, 88, 95, 96]  
group3 = [79, 78, 88, 94, 92, 85, 83, 85, 82, 81]
```

Step 2: Perform the one-way ANOVA.

Next, we'll use the **f_oneway()** function from the SciPy library to perform the one-way ANOVA:

A one-way ANOVA uses the following null and alternative hypotheses:

● **H0 (null hypothesis):** $\mu_1 = \mu_2 = \mu_3 = \dots = \mu_k$ (all the population means are equal)

● **H1 (alternative hypothesis):** at least one population mean is different from the rest.

```
from scipy.stats import f_oneway

#perform one-way ANOVA
f_oneway(group1, group2, group3)

(statistic=2.3575, pvalue=0.1138)
```

Step 3: Interpret the results.

A one-way ANOVA uses the following null and alternative hypotheses:

● **H0 (null hypothesis):** $\mu_1 = \mu_2 = \mu_3 = \dots = \mu_k$ (all the population means are equal)

● **H1 (alternative hypothesis):** at least one population mean is different from the rest.

Corresponding p-value is 0.1138. Since the p-value is not less than .05, we fail to reject the null hypothesis.

This means we do not have sufficient evidence to say that there is a difference in exam scores among the three studying techniques.

Assignment

Using our school dataset and using One Way Anova, check whether the means for English, Writing and Reading are equal or Not.
